Chapter 1

Installation

1.1 System Requirements

MicroTESK is a set of Java-based utilities that are run from the command line. It can be used on *Windows*, *Linux* and *OS X* machines that have *JDK 1.7 or later* installed. To build MicroTESK from source code or to build the generated Java models, *Apache Ant version 1.8 or later* is required. To generate test data based on constraints, MicroTESK needs the *Microsoft Research Z3* or *CVC4* solver that can work under the corresponding operating system.

1.2 Command-Line Options

MicroTESK works in two modes: specification translation and test generation, which are enabled with the `-translate` (used by default) and `-generate` keys correspondingly. In addition, the `-help` key prints information on the command-line format.

The `-translate` and `-generate` keys are inserted into the command-line by `compile.sh/compile.bat` and `generate.sh/generate.bat` scripts correspondingly. Other options should be specified explicitly to customize the behavior of MicroTESK. Here is the list of options:

Full name	Short name	Description	Requires
-help	-h	Shows help message	
-verbose	-v	Enables printing diagnostic messages	
-translate	-t	Translates formal specifications	
-generate	-g	Generates test programs	
-output-dir <arg>	-od	Sets where to place generated files	
-include <arg>	-i	Sets include files directories	-translate
-extension-dir <arg>	-ed	Sets directory that stores user-defined Java code	-translate
-random-seed <arg>	-rs	Sets seed for randomizer	-generate
-solver <arg>	-s	Sets constraint solver engine to be used	-generate
-branch-exec-limit <arg>	-bel	Sets the limit on control transfers to detect endless loops	-generate
-solver-debug	-sd	Enables debug mode for SMT solvers	-generate
-tarmac-log	-tl	Saves simulator log in Tarmac format	-generate
-self-checks	-sc	Inserts self-checking code into test programs	-generate
-arch-dirs <arg>	-ad	Home directories for tested architectures	-generate
-rate-limit <arg>	-rl	Generation rate limit, causes error when broken	-generate
-code-file-extension <arg>	-cfe	The output file extension	-generate
-code-file-prefix <arg>	-cfp	The output file prefix (file names are as follows prefix_xxxx.ext, where xxxx is a 4-digit decimal number)	-generate
-data-file-extension <arg>	-dfe	The data file extension	-generate
-data-file-prefix <arg>	-dfp	The data file prefix	-generate
