Overview

Installation

2.1 System Requirements

MicroTESK is a set of Java-based utilities that are run from the command line. It can be used on *Windows*, *Linux* and *OS X* machines that have *JDK 1.7 or later* installed. To build MicroTESK from source code or to build the generated Java models, *Apache Ant version 1.8 or later* is required. To generate test data based on constraints, MicroTESK needs the *Microsoft Research Z3* or *CVC4* solver that can work on the corresponding operating system.

2.2 Installation Steps

To install MicroTESK, the following steps should be performed:

- 1. Download from http://forge.ispras.ru/projects/microtesk/files and unpack the MicroTESK installation package (the .tar.gz file, latest release) to your computer. The folder to which it was unpacked will be further referred to as the installation directory (<installation dir>).
- 2. Declare the MICROTESK_HOME environment variable and set its value to the path to the installation directory (see the Setting Environment Variables section).
- 3. Set the <installation dir>/bin folder as the working directory (add the path to the PATH environment variable) to be able to run MicroTESK utilities from any path.
- 4. Note: Required for constraint-based generation. Download and install constraint solver tools to the <installation dir>/tools directory (see the Installing Constraint Solvers section).

2.2.1 Setting Environment Variables

Windows

1. Open the System Properties window.

- 2. Switch to the Advanced tab.
- 3. Click on Environment Variables.
- 4. Click New.. under System Variables.
- 5. In the New System Variable dialog, specify variable name as MICROTESK_HOME and variable value as <installation dir>.
- 6. Click OK on all open windows.
- 7. Reopen the command prompt window.

Linux and OS X

Add the command below to the $\tilde{\ }$.bash_profile file (Linux) or the $\tilde{\ }$ /.profile file ($OS\ X$):

```
export MICROTESK_HOME=<installation dir>
```

To start editing the file, type vi ~/.bash_profile (or vi ~/.profile). Changes will be applied after restarting the command-line terminal or reboot. You can also run the command in your command-line terminal to make temporary changes.

2.2.2 Installing Constraint Solvers

To generate test data based on constraints, MicroTESK requires external constraint solvers. The current version supports the Z3 and CVC4 constraint solvers. Constraint executables should be downloaded and placed to the <installation dir>/tools directory.

Using Environment Variables

If solvers are already installed in another directory, to let MicroTESK find them, the following environment variables can be used: Z3_PATH and CVC4_PATH. They specify the paths to the Z3 and CVC4 excutables correspondingly.

Installing Z3

- Windows users should download Z3 (32 or 64-bit version) from the following page:http://z3.codeplex.com/releases and unpack the archive to the <installation dir>/tools/z3/windows directory. Note: the executable file path is <windows>/z3/bin/z3.exe.
- *UNIX* and *Linux* users should use one of the links below and and unpack the archive to the <installation dir>/tools/z3/unix directory. Note: the executable file path is <unix>/z3/bin/z3.

Debian x64	http://z3.codeplex.com/releases/view/101916
Ubuntu x86	http://z3.codeplex.com/releases/view/101913
Ubuntu x64	http://z3.codeplex.com/releases/view/101911
FreeBSD x64	http://z3.codeplex.com/releases/view/101907

• OS X users should download Z3 from http://z3.codeplex.com/releases/view/101918 and unpack the archive to the <installation dir>/z3/osx directory. Note: the executable file path is <osx>/z3/bin/z3.

Installing CVC4

- Windows users should download the latest version of CVC4 binary from http://cvc4.cs.nyu.edu/builds/win32-opt/ and save it to the <installation dir>/tools/cvc4/windows directory as cvc4.exe.
- Linux users download the latest version of CVC4 binary from http://cvc4.cs.nyu.edu/builds/i386-linux-opt/unstable/ (32-bit version) or http://cvc4.cs.nyu.edu/builds/x86_64-linux-opt/unstable/ (64-bit version) and save it to the <installation dir>/tools/cvc4/unix directory as cvc4.
- OS X users should download the latest version of CVC4 distribution package from http://cvc4.cs.nyu.edu/builds/macos/ and install it. The CVC4 binary should be copied to <installation dir>/tools/cvc4/osx as cvc4 or linked to this file name via a symbolic link.

2.3 Installation Directory Structure

The MicroTESK installation directory contains the following subdirectories:

arch	ch Microprocessor specifications and test templates		
bin	Scripts to run modeling and test generation tasks		
\mathbf{doc}	oc Documentation		
etc	etc Configuration files		
gen	Generated code of microprocessor models		
lib	b JAR files and Ruby scripts to perform modeling and		
	test generation tasks		
src	Source code of MicroTESK		

2.4 Running

To generate a Java model of a microprocessor from its nML specification, a user needs to run the compile.sh script (Unix, Linux, OS X) or the compile.bat script (Windows). For example, the following command generates a model for the miniMIPS specification:

sh bin/compile.sh arch/minimips/model/minimips.nml

NOTE: Models for all demo specifications are already built and included in the MicroTESK distribution package. So a user can start working with MicroTESK from generating test programs for these models.

To generate a test program, a user needs to use the generate.sh script (Unix, Linux, OS X) or the generate.bat script (Windows). The scripts require the following parameters:

- model name;
- test template file;
- target test program source code file.

For example, the command below runs the euclid.rb test template for the miniMIPS model generated by the command from the previous example and saves the generated test program to an assembler file. The file name is based on values of the -code-file-prefix and -code-file-extension options.

```
sh bin/generate.sh minimips arch/minimips/templates/euclid.rb
```

To specify whether Z3 or CVC4 should be used to solve constraints, a user needs to specify the -s or -solver command-line option as z3 or cvc4 respectively. By default, Z3 will be used. Here is an example:

```
sh bin/generate.sh -s cvc4 minimips arch/minimips/templates/constraint.rb
```

More information on command-line options can be found on the Command-Line Options section.

2.5 Command-Line Options

MicroTESK works in two modes: specification translation and test generation, which are enabled with the -translate (used by default) and -generate keys correspondingly. In addition, the -help key prints information on the command-line format.

The -translate and -generate keys are inserted into the command-line by compile.sh/compile.bat and generate.sh/generate.bat scripts correspondingly. Other options should be specified explicitly to customize the behavior of MicroTESK. Here is the list of options:

Full name	Short	Description	Requires
	name	-	_
-help	-h	Shows help message	
-verbose	-V	Enables printing diagnostic	
		messages	
-translate	-t	Translates formal specifica-	
		tions	
-generate	-g	Generates test programs	
-output-dir <arg></arg>	-od	Sets where to place gener-	
		ated files	
-include <arg></arg>	-i	Sets include files directories	-translate
-extension-dir <arg></arg>	-ed	Sets directory that stores	-translate
		user-defined Java code	
-random-seed <arg></arg>	-rs	Sets seed for randomizer	-generate
-solver <arg></arg>	-s	Sets constraint solver engine	-generate
		to be used	
-branch-exec-limit	-bel	Sets the limit on control	-generate
<arg></arg>		transfers to detect endless	
		loops	
-solver-debug	-sd	Enables debug mode for	-generate
		SMT solvers	
-tarmac-log	-tl	Saves simulator log in Tar-	-generate
		mac format	
-self-checks	-sc	Inserts self-checking code	-generate
		into test programs	
-arch-dirs <arg></arg>	-ad	Home directories for tested	-generate
		architectures	
-rate-limit <arg></arg>	-rl	Generation rate limit,	-generate
		causes error when broken	
-code-file-extension	-cfe	The output file extension	-generate
<arg></arg>			

-code-file-prefix	-cfp	The output file prefix (file	-generate
<arg></arg>		names are as follows pre-	
		fix_xxxx.ext, where xxxx is	
		a 4-digit decimal number)	
-data-file-extension	-dfe	The data file extension	-generate
<arg></arg>			
-data-file-prefix	-dfp	The data file prefix	-generate
<arg></arg>			
-exception-file-prefix	-efp	The exception handler file	-generate
<arg></arg>		prefix	
-program-length-limit	-pll	The maximum number of	-generate
<arg></arg>		instructions in output pro-	
		grams	
-trace-length-limit	-tll	The maximum length of	-generate
<arg></arg>		execution traces of output	
		programs	
-comments-enabled	-ce	Enables printing comments;	-generate
		if not specified no comments	
		are printed	
-comments-debug	-cd	Enables printing detailed	-generate
		comments; must be used	
		together with –comments-	
		enabled	

Test Templates

3.1 Introduction

MicroTESK generates test programs on the basis of *test templates* that describe test programs to be generated in an abstract way. Test templates are created using special Ruby-based test template description language. The language is implemented as a library that includes provides facilities for describing test cases.

MicroTESK uses the JRuby interpreter to process test templates. This allows Ruby libraries to interact with other components of MicroTESK written in Java.

Test templates are processed in two stages:

- Ruby code is executed to build the internal representation (a hierarchy of Java objects) of the test template.
- The internal representation is processed with various engines to generate test cases which are then simulated on the reference model and printed to files.

This chapter describes facilities of the test template description language and supported test generation engines.

3.2 Test Template Structure

A test template is implemented as a class inherited from the Template library class that provides access to all features of the library. Information on the location of the Template class is stored in the TEMPLATE environment variable. Thus, the definition of a test template class looks like this:

```
require ENV['TEMPLATE']
class MyTemplate < Template</pre>
```

Test template classes should contain implementations of the following methods:

- 1. **initialize** (optional) specifies settings for the given test template;
- 2. **pre** (optional) specifies the initialization code for test programs;

- 3. **post** (optional) specifies the finalization code for test programs;
- 4. **run** specifies the main code of test programs (test cases).

The definitions of optional methods can be skipped. In this case, the default implementations provided by the parent class will be used. The default implementation of the initialize method initializes the settings with default values. The default implementations of the pre and post methods do nothing.

The full interface of a test template looks as follows:

```
require ENV['TEMPLATE']

class MyTemplate < Template

def initialize
    super
    # Initialize settings here
end

def pre
    # Place your initialization code here
end

def post
    # Place your finalization code here
end

def run
    # Place your test problem description here
end</pre>
```

3.3 Reusing Test Templates

It is possible to reuse code of existing test templates in other test templates. To do this, you need to subclass the template you want to reuse instead of the Template class. For example, the MyTemplate class below reuses code from the MyPrepost class that provides initialization and finalization code for similar test templates.

```
require ENV['TEMPLATE']
require_relative 'MyPrepost'

class MyTemplate < MyPrepost

def run
    ...
end
end</pre>
```

Another way to reuse code is creating code libraries with methods that can be called by test templates. A code library is defined as a Ruby module file and has the following structure:

```
module MyLibrary

def method1
    ...
  end

def method2(arg1, arg2)
    ...
  end

def method3(arg1, arg2, arg3)
    ...
  end

end

end
```

To be able to use utility methods method1, method2 and method3 in a test template, the MyLibrary module must be included in that test template as a mixin. Once this is done, all methods of the library are available in the test template. Here is an example:

```
require ENV['TEMPLATE']
require_relative 'my_library'

class MyTemplate < Template
  include MyLibrary

  def run
    method1
    method2 arg1, arg2
    method3 arg1, arg2, arg3
  end
end</pre>
```

3.4 Test Template Settings

Test templates use the following settings:

- 1. Starting characters for single-line comments;
- 2. Starting characters for multi-line comments;
- 3. Terminating characters for multi-line comments;
- 4. Indentation token;
- 5. Token used in separator lines.

Here is how these settings are initialized with default values in the Template class:

```
@sl_comment_starts_with = "//"
@ml_comment_starts_with = "/*"
@ml_comment_ends_with = "*/"

@indent_token = "\t"
@separator_token = "="
```

The settings can be overridden in the initialize method of a test template. For example:

```
class MyTemplate < Template

def initialize
    super

    @sl_comment_starts_with = ";"
    @ml_comment_starts_with = "/="
    @ml_comment_ends_with = "=/"

    @indent_token = "____"
    @separator_token = "*"
    end
    ...
end</pre>
```

3.5 Data Definitions

3.5.1 Configuration

Defining data requires the use of assembler-specific directives. Information on these directives is not included in ISA specifications and should be provided in test templates. It includes textual format of data directives and mappings between nML and assembler data types used by these directives. Configuration information on data directives is specified in the data_config block, which is usually placed in the pre method. Only one such block per a test template is allowed. Here is an example:

```
data_config(:text => '.data', :target => 'M') {
  define_type :id => :byte, :text => '.byte', :type => type('card', 8)
  define_type :id => :half, :text => '.half', :type => type('card', 16)
  define_type :id => :word, :text => '.word', :type => type('card', 32)

define_space :id => :space, :text => '.space', :fillWith => 0
  define_ascii_string :id => :ascii, :text => '.ascii', :zeroTerm => false
  define_ascii_string :id => :asciiz, :text => '.asciiz', :zeroTerm => true
}
```

The block takes the following parameters:

• text (compulsory) - specifies the keyword that marks the beginning of the data section in the generated test program;

- target (compulsory) specifies the memory array defined in the nML specification to which data will be placed during simulation;
- base_virtual_address (optional) specifies the base virtual address where data allocation starts. Default value is 0;
- item_size (optional) specifies the size of a memory location unit pointed by address. Default value is 8 bits (or 1 byte).

To set up particular directives, the language provides special methods that must be called inside the block. All the methods share two common parameters: id and text. The first specifies the keyword to be used in a test template to address the directive and the second specifies how it will be printed in the test program. The current version of MicroTESK provides the following methods:

- 1. **define_type** defines a directive to allocate memory for a data element of an nML data type specified by the type parameter;
- 2. define_space defines a directive to allocate memory (one or more addressable locations) filled with a default value specified by the fillWith parameter;
- 3. define_ascii_string defines a directive to allocate memory for an ASCII string terminated or not terminated with zero depending on the zeroTerm parameter.

The above example defines the directives byte, half, word, ascii (non-zero terminated string) and asciiz (zero terminated string) that place data in the memory array M (specified in nML using the mem keyword). The size of an addressable memory location is 1 byte.

3.5.2 Definitions

After all data directives are configured, data can be defined using the data construct, which has two optional parameters:

- global a boolean value that states that the data definition should be treated as global.
- separate_file a boolean value that states that the generated data definitions should be placed in a separate source code file.

```
data {
  label :data1
  byte 1, 2, 3, 4

  label :data2
  half OxDEAD, OxBEEF

  label :data3
  word OxDEADBEEF
```

```
label :hello
ascii 'Hello'

label :world
asciiz 'World'

space 6
}
```

In this example, data is placed into memory. Data items are aligned by their size (1 byte, 2 bytes, 4 bytes). Strings are allocated at the byte border (addressable unit). For simplicity, in the current version of MicroTESK, memory is allocated starting from the address 0 (in the memory array of the executable model).
